Name: Test Student Class: 6C

2 (i) The angle of incidence equals the angle of reflection, and both rays lie in one plane.

5 (a) Current through a conductor is proportional to the potential difference across it.

5 (b) $R = V / I = 10 / 2 = 5$ ohm.

3. Water is denser than air, so sound waves travel through it more quickly.

1. Refraction is the bending of light when it passes from one medium to another.

6. Weigh a sealed flask, pump the air out, and weigh it again. The mass decreases.

2 (ii) The watt.

2 (i) (a) Diagram drawn with incident ray, normal and reflected ray labelled.

4. A current-carrying coil placed in a magnetic field experiences a force, which turns the coil and converts electrical energy into rotation.
