

Name: Test Student Class: 6C

Refraction is the bending of light when it passes from one medium to another.

The angle of incidence equals the angle of reflection, and both rays lie in one plane.

Diagram drawn with incident ray, normal and reflected ray labelled.

The watt.

Water is denser than air, so sound waves travel through it more quickly.

A current-carrying coil placed in a magnetic field experiences a force, which turns the coil and converts electrical energy into rotation.

Current through a conductor is proportional to the potential difference across it.

$$R = V / I = 10 / 2 = 5 \text{ ohm.}$$

Weigh a sealed flask, pump the air out, and weigh it again. The mass decreases.
